A programmable logic controller is an electronic system that receives input signals, analyzes them according to a user-generated program commonly known as a LADDER diagram. and produces output signals for process

### **Programmable Logic Controllers Fundamentals**

Focus on the fundamentals of PLCs from setting up communications to uploading and downloading programs to troubleshooting and modifying the system. Spend 65% of the class time on various PLCs working on hands-on exercises. Working in small groups, learn to program, connect input/output devices and solve elementary and complex problems.

for implementing the logic, and controlling the communications among the modules. â€¢ Designed so the desired circuit can be entered in relay ladder logic form. â€¢ The processor accepts input data from various sensing devices, executes the stored user program, and sends appropriate output commands to control devices.

### **Introduction to Programmable Logic Controllers (PLC's)**

The first Programmable Logic Controller (PLC) was developed by a group of engineers at General Motors in 1968, when the company were looking for an alternative to replace complex relay control systems.

### **Programmable Logic Controllers, Basic Level (Textbook)**

In this PLC fundamentals training, students focus on the fundamentals of Programmable Logic Controllers (PLCs) from setting up communications to uploading and downloading programs to troubleshooting and modifying the system.

Logic 0, Logic 1 Programmable controllers can only understand a signal that is On or Off (present or not present). The binary system is a system in which there are only two numbers, 1 and 0. Binary 1 indicates that a signal is present, or the switch is On. Binary 0 indicates that the signal is not present, or the switch is Off.
