PCI-X, short for Peripheral Component Interconnect eXtended, is a computer bus and expansion card standard that enhances the 32-bit PCI local bus for higher bandwidth demanded mostly by servers and workstations. It uses a modified protocol to support higher clock speeds (up to 133 MHz), but is otherwise similar in electrical implementation. PCI-X 2.0 added speeds up to 533 MHz: 23, with a ...

PCI Express devices communicate via a logical connection called an interconnect or link. A link is a point-to-point communication channel between two PCI Express ports allowing both of them to send and receive ordinary PCI requests (configuration, I/O or memory read/write) and interrupts (INTx, MSI or MSI-X). At the physical level, a link is composed of one or more lanes.

How can I tell the difference between PCI, PCI-X and PCI Express? - *Click on the picture for a better view of the chart. A connection between any two PCIe devices is known as a "link", and is built up from a collection of 1 or more lanes. All devices must minimally support single-lane (x1) links. Devices may optionally support wider links composed of 2, 4, 8, 12, 16, or 32 lanes.

Desarrollo. PCI-X se desarrolló conjuntamente con IBM, HP y Compaq y presentada para su aprobación en 1998. Se esforzó en codificar extensiones propietarias de servidor al bus local para incrementar el rendimiento de los dispositivos de banda ancha como tarjetas Ethernet Gigabit, Canal de Fibra y SCSI y permitir a los procesadores ser interconectados en clusters.

PCI (Peripheral component interconnect, is a standard for hardware devices to communicate with a computer system. It is a type of bus architecture that allows for the connection of various peripheral devices to a computer system. The PCI standard is used for a wide range of devices, including graphics cards, network cards, sound cards, and modems. The PCI standard is also used for the connection of external storage devices, such as hard drives and solid state drives. The PCI standard is a widely used and reliable standard for connecting hardware devices to a computer system.

The PCI 1.0 was launched on June 22, 1992, and was only a specification at the component level. The PCI 2.0, launched in 1993, was the first to establish the standard for the connector and the slot (slot) of the base board. The PCI 2.1 was introduced to the market on June 1, 1995. PCI was immediately put into use by servers, replacing the MCA and EISA buses as options ...
